

Assignment 2 — Pivot Report

Minds for Care: Global Mental Health Concern Dashboard

1. Phase 1: WHAT? — Deconstruction

1.1 Data Audit (SILO 1)

The *Minds for Care* dashboard was created by Ananya Dikshit and published as a Tableau Viz of the Day (VOTD) for B2VB2025 Week 20. The data comes from the **Ipsos Health Service Report 2024** — a large-scale global survey measuring how concerned people in different countries feel about mental health. Because the data could not be downloaded directly, the structure was worked out by reading the visible axes, filters, and heatmap values. Three clear variables were found:

- **Country** — 31 nations listed by name (categorical, nominal).
- **Year** — five annual snapshots from 2020 to 2024 (ordinal, discrete).
- **Concern %** — the percentage of people in each country who expressed concern about mental health, ranging from 8% (Mexico, 2020) to 69% (Chile, 2024) (quantitative, continuous).

One important limitation is that five countries — Colombia, Indonesia, Ireland, New Zealand, and Singapore — have missing data for earlier years, which makes full year-on-year comparison impossible for those nations. A global country average was calculated separately and used throughout the pivot as a benchmark.

1.2 Why Was This a Viz of the Day? (SILO 2)

The dashboard stands out because it does things that most Tableau charts do not. Instead of a plain bar or line chart, it uses a **custom purple gradient heatmap** where darker colours mean higher concern — you can understand the pattern instantly without reading a single number. The bar chart on the left replaces normal bars with **head-shaped icons**, making the mental health theme feel personal and memorable. These design choices make the dashboard visually striking and reward users who want to explore data deeply across 31 countries and 5 years.

1.3 The Limitation — Who Struggles With This Dashboard?

The dashboard is built for people who enjoy exploring data. But for someone who just needs a quick answer — like a **Health Policy Advisor** at the Australian Department of Health — it creates a serious problem. There is a long block of text at the start that has to be read before any data is visible. The 31-country table cannot be sorted or searched, so finding Australia means scanning every single row. The icon bar chart looks interesting but gives no precise numbers. And there is no way to filter by year or country because the whole dashboard is completely static.

2. Phase 2: SO WHAT? — The Narrative Pivot

2.1 Persona and User Story (SILO 3)

Persona: Australian Health Policy Advisor

User Story: *“As a health policy advisor, I need to immediately see where Australia ranks globally in mental health concern so I can justify increased budget allocation to government stakeholders.”*

2.2 Where the Original Dashboard Fails This Persona

(1) Dense Prose Block — Red Zone: A long paragraph and italic quote appear before any data. For a time-poor advisor, this is an immediate wall — there is no headline, no key number, and nothing actionable in sight.

(2) 31-Country Unsortable Table — Red Zone: All 31 countries sit in fixed alphabetical order. There is no sort button, no search, and no filter. Finding Australia means reading every row from top to bottom — slow and frustrating.

(3) No Interactivity — Red Zone: The dashboard cannot be filtered by year or country. The advisor has no way to focus on Australia or on 2024 specifically — they must look at everything at once.

(4) Five Years at Equal Weight — Yellow Zone: All five year columns look exactly the same. The 2024 data — the only year that matters for current policy decisions — gets no special emphasis and is easy to overlook.

(5) Decorative Icon Bar Chart — Yellow Zone: The global average trend uses head icons instead of real bars. There is no scale and no exact numbers. It looks creative but tells the advisor nothing they can actually use.

2.3 The Golden Thread

(6) Golden Thread — 2024 Concern % by Country: Hidden inside the heatmap is the one number that matters: Australia in 2024 sits at **60%** — fifteen percentage points above the global average of **45%**. This places Australia in the top four most concerned nations globally, above comparable peers including the United States (52%), Canada (57%), and Great Britain (54%). This single gap is the strongest possible justification for urgent budget action.

3. Phase 3: WHAT NEXT? — The Pivot

3.1 Why Datawrapper?

Reason	Why it fits this persona
Editorial style	Looks like the charts in The Economist or ABC News — exactly what a policy advisor reads every day.
Instant clarity	One chart, readable in under five seconds, no interaction needed.
Mobile-friendly	Works on phones and tablets — the advisor can check it between meetings.
Live URL	Publishes directly to a shareable link, satisfying the submission requirement.
Reference line	A built-in dashed line sits at 45% (global average), framing Australia’s position without any explanation.

Flourish was considered but rejected — its animated scrollytelling works better for public journalism than executive briefings. Tableau Story was rejected because it still requires technical navigation. Datawrapper gives a clean, credible, at-a-glance result with no friction.

3.2 What the Pivot Looks Like

The published chart at datawrapper.de/_/CNmJB shows eight countries as horizontal bars, ranked from highest to lowest concern in 2024. Four design decisions drive the clarity:

- **Australia in bold blue:** The eye goes straight to it. No scanning needed.
- **Global Average in amber:** A second visual anchor that immediately stands apart from all comparison nations.
- **Dashed reference line at 45%:** A clear boundary between countries above and below the global average — the key decision line for budget allocation.

- **Title and subtitle:** The question “Where Does Australia Stand?” and the answer “15 percentage points above the global average” are both visible before the chart is even read.

What this pivot achieves: The original dashboard had six friction points that blocked the persona from getting a useful answer. The Datawrapper chart removes all of them. The advisor sees Australia at 60% versus a global average of 45% in under five seconds — no text to read, no rows to scan, no filters to apply. That is the entire point of the pivot.
